

AI-Based artwork restoration system

Problem statement

Many historical artworks and cultural artifacts are being damaged over time due to aging, environmental conditions, natural disasters, and human activities. Preserving and analyzing these cultural assets is challenging because relevant information is often scattered across images, videos, audio narrations, and historical documents. The loss of visual details and historical context makes restoration and cultural preservation difficult for museums, historians, and heritage organizations.

Scope of the project

The scope of this project is limited to the digital analysis and restoration of damaged historical artworks using multimedia information sources. The project focuses on analyzing artwork images along with related videos, audio narrations, and textual descriptions to study damage patterns and historical context. It aims to support cultural preservation activities by providing a unified platform for artwork understanding, restoration visualization, and historical information management for museums, educational institutions, and heritage organizations.
